AUTHOR: Syroyechkovskiy, Ye.Ye., Candidate of Geographical Sciences

TITLE: ~~\_\_\_\_\_~~ Flight of Birds Over the Yenisey (Prolët ptits na Yeniseye)

PERIODICAL: Priroda, 1958, Nr 5, p 126 (USSR)

ABSTRACT: The author gives a brief survey on the migration of wild water fowl over the Yenisey river in May of 1956 as observed in the Komsa region (61°50'N). The temperature from 1 to 6 May was 1 to 4°C above zero, on 7 May 9°C. On 14 May, the temperature dropped suddenly, the cold spell lasting until 21 May. During this period many northbound birds hurriedly returned. Wild ducks suffered most from the rigid temperatures. Ice drifts on the river started on 16 May. On some days 1,500 to 1,800 water fowl were observed, the average number being not more than 300 to 500. As for swans, only 5 to 7 were seen at a time. Generally speaking, the middle course of the Yenisey river is of little importance to the migrating wild water fowl and only comparatively few stop on its banks for intermittent feeding purposes. Only beyond the mouth of the Angara river the migrating flocks increase in number. From Turukhansk on the number becomes definitely higher.

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 5,  
pp 1077-1080 (USSR)

ABSTRACT:

The material for this paper was collected in the Antarctic  
in January-April 1957. The coast and some interior regions  
within Queen Mary Land, the Kaiser Wilhelm II Land and the  
western part of the coast of Knox Land were investigated.  
In the author's opinion the biogeographic study should be  
based on the geography of the biocoenoses. The division  
into regions should be based upon the similarity or the  
differences of the biocoenoses. First of all, those basic  
processes come into question which proceed within it and  
determine the chief direction of the circulation of the  
materials in a given continent or water sector (compare Ref 1).  
For such purposes those sectors of the mainland which lie

Central Sector of the East Antarctic)

SOV/20-125-5-34/61

in the raw polar regions and have impoverished biologic complexes are especially well suited. To these belongs above all the Antarctic continent. Its biocomplexes are marked by 3 main characteristics: 1. They are extremely impoverished. As a result of the ice-formation and the raw temperature conditions of the air and ground, practically no cold blooded (poikilothermal) land animals can live here; in addition, also relatively few mobile warm blooded animals (homiothermal animals) which are not connected with the ocean. The birds alone which are capable of migration in the air or water environments form the majority of the land animals. The number of species is small (14 - 15; of these only 11 build nests). The conditions are also unfavorable for the land plants. Practically only spore plants occur here (algae, lichen, mosses, fungi). Since higher plants are lacking on the continent, the solar energy is chiefly utilized by the photosynthesis of the plankton. 2. The simplicity and clearness of the biocoenotic relations. Thus, for example, the composition of the nourishment is very

Central Sector of the East Antarctic)

SOV/20-125-5-34/61

monotonous: at least 90 % of the marine food of the birds consists of small planktonic crabs of the genus *Euphasia*. Remains of fish, cephalopods or other crab animals are rarely found in the stomachs of birds. Stercorariinae of the Antarctic (Bangers oasis) are practically monophags. Hundreds of "snow storm bird" skeletons and only individual remains of cephalopods are to be found near their nests. 3. Life in the Antarctic is by and large concentrated on the periphery of the continent. The continental organisms are dependent on the life activity of the ocean (Refs 2, 3). The author designates the following "Living Arenas" on the basis of the above: I. A r e n a o f t h e A n t a r c t i c i c e s h i e l d . These are ice, individual mountains and nunataks deep in the continent. Permanent life only in ice-free localities. Direct connection to the ocean is lacking. II. A r e n a o f i n i t i a l i c e - f r e e m a i n l a n d ( y o u n g c o l d d e s e r t s ) . Mostly separated from the ocean by continental ice. Here appear the first, though rare,

SOV/20-125-5-34/61

vertebrate animals. First connections to the ocean originate.  
Type area of the "oasis covered with snow". III. Arena  
of the Antarctic coastal oases  
(arena of the cold deserts).  
Usually connected to the ocean or ocean bays. Vegetation  
richer than in I or II. Seals on the coast, some birds.  
IV. Arena of the coastal islands  
and of the coastal ice. Strong  
preponderance (chiefly as regards the biomass) of continental  
animals and plants at the expense of the ocean. Coprophilous  
algae in the excrement of the birds. First primitive soils.  
V. Arena of the Subantarctic  
islands. Appearance of higher plants and plant  
eating animals connected with them. Beginning of direct  
trophic connections to the mainland at the expense of the  
photosynthesis of the higher plants. There are 1 figure and  
3 references, 1 of which is Soviet.

Elektroliz sernokisllogo tsinka (Electrolysis of zinc Sulfate) Moscow, Metallurgizdat, 1959. 184 p. 2,000 copies printed.

Scientific Ed.: V.V. Stender, Doctor, Professor, Corresponding Member, Academy of Sciences, Kazakh SSR; Ed.: S.Ya. Petker; Ed. of Publishing House: M.S. Arkhangel'skaya; Tech. Ed.: V.V. Mikhaylova.

PURPOSE: This book is intended for engineers and technicians and may also be useful to students of metallurgical vuzes.

COVERAGE: The book deals with the theory and practice of the production of electrolytic zinc from sulfate solutions. Properties of zinc sulfate are discussed, and equipment used for electrolysis is described. A.I. Gayev, O.A. Yesin, and Yu. V. Baymakov are among those who have done research in this field. The authors thank V.V. Stender Doctor, Professor, Corresponding Member, Academy of Sciences, Kazakh SSR; V.D. Ponomarev, Professor, Doctor of Technical Sciences, Honored Scientist and Engineer, Academy of Sciences, Kazakh SSR; and A.L. Rotinyan, Doctor of Technical Sciences. 1336. INFLUENCE OF ANTIBIOTICS ON THE PHAGOCYtic ACTIVITY OF LEUCOCYTES IN THE BLOOD OF PATIENTS WITH SYPHILIS (Russian text) - Syroezhkina A. A. - NAUCH. ZAP. GORK. INST. DERM. I VENER. KAF. KOZHNO-VENER. BOLEZ. GGMI 1956, 17 (193-195)

The phagocytic index was determined in 36 patients in various stages of syphilis, mostly with active clinical manifestations. Five to six million units of penicillin or ekmonovocillin (procaine penicillin) was given for a course of treatment. It was found that the antibiotics enhanced the phagocytic reaction in the body and highly increased the phagocytic index in several patients. (S)

 New results on indirect hydration of ethylene. A. Klina,  
 J. Matějček, V. Štecl, and J. Sedláček. *Chem. průmysl* 7,  
 113-22 (1957).—The influence of temp.,  $H_2SO_4$  concn.,  $C_2H_4$   
 partial pressure, and agitation speed have been studied on lab.  
 and pilot plant scale to develop optimum economy of the  
 process. An increase of partial pressure of  $C_2H_4$  from 10 to  
 23.5 atm. could reduce the  $H_2SO_4$  consumption by 7-17% in  
 one working cycle and the losses of acid by 4-8%. The re-  
 action time was shortened by 25-50%. On a plant scale in  
 continuous mixing reactors it is possible to reduce the  
 agitation speed by 50%; 93%  $H_2SO_4$  was found to be more  
 economical than the 94% acid. L. A. Helwich

AUTHOR: Syrtsov, V. (Krasnyy Kut)

TITLE: A Student-Pilot Makes a Decision

PERIODICAL: Grazhdanskaya aviatsiya, 1959, Nr 10, p 29 (USSR)

ABSTRACT: This is a note praising the self-control and skillful action of student-pilot Mikhaylin, whose training flight was interrupted by engine trouble, and who managed to reach his airfield and land there without accident.

Behavior of diacid-bis-dimethylglyoxyacids in aqueous solution. A. V. Akhlov and G. P. Syrtsova (State Univ. Kishinev), *Zh. Fiz. Khim.* 1, 2457-58 (1966). -- A study of the elec. cond. of aq. solns. of the acids  $[H_2Co(DH)_2X_2]$  ( $X = Cl, Br, I, CNS, NO_2$ ) and of the salts  $[Co(NH_3)_4(DH)_2X_2]$   $[Co(DH)_2X_2]$  showed that the halogen atoms are displaced with  $H_2O$  mols. Potentiometric titration with an alkali showed that  $H[Co(DH)_2(NO_2)_2]$  acts like a strong acid and is not hydrated. Besides the process of neutralization, the acids contg. the residues  $X = Cl, Br, CNS$  also react with alkalis to form hydrated  $[Co(DH)_2X_2]^-$  anions. Addn. of salts  $MX$  to the acids leads to extensive hydration in the cases where  $X = CNS$  and  $I$ . The hydration occurs to a lesser degree where  $X = Cl$  or  $Br$ .  
I. Rovtar Leach.
